

Introduce yourself

My journey in electronics, industrial automation, robotics, and programming electrical devices began during vocational secondary school, where I laid a solid foundation. However, my thirst for knowledge drove me to pursue self-directed learning, significantly enhancing my skills and expertise. I've participated in numerous competitions and even undertook an Erasmus program to further refine my capabilities. Currently, I'm continuing my education at Subotica Tech, majoring in Mechatronics Engineering, with a focus on integrating my theoretical knowledge with practical applications.

In the WRO robotics competition of May 2023, I secured 7th place.

March 2023, I clinched 4th place in a National competition focusing on electronic construction.

Despite tough competition, I achieved 52nd place in a National programming competition in November 2022.

In the WRO robotics competition of May 2022, I proudly secured 2nd place.

Additionally, I claimed 1st place in the Make Robot competition.

My proficiency spans a wide range of tools and platforms, including hardware design tools like Altium Designer, LTspice and KiCAD, industrial automation tools such as Automation Studio ProgeCAD, Simatic manager and CODESYS, and firmware development tools like STM32CubeIDE VsCode, STM32CubeMX, Microchip Studio and Arduino IDE. I'm well-versed in hardware design, board bring-up and repair, PLC programming, industrial automation and embedded firmware development using C/C++. Moreover, I possess skills in 3D printing, CAD (Autodesk Inventor), Linux, Python, and C/C++ software development, along with experience in maintaining computer systems.

As a Software Developer for the WRO robotics competition, I played a pivotal role in designing and developing custom mechanical and software solutions. I engineered custom software for the EV3 robot platform, implementing advanced algorithms for optimized navigation. In another role as an Electrical Technician, I conceptualized and designed a versatile robotic platform for a National-level competition, showcasing my prowess in electronic construction and algorithmic design. During my Erasmus program internship, I gained comprehensive knowledge in robotics programming and automation systems, enhancing my teamwork skills through collaborative projects.

One of my notable projects involved developing tailored drivers for various components on the STM32 MCU platform, demonstrating expertise in sensor data processing and motor control. Another project centered on creating a bespoke three-floor elevator model, utilizing Logo PLC for seamless operation and implementing a user-friendly mobile phone application for control.

Currently, I'm pursuing a degree in Mechatronics Engineering at Subotica Tech, building upon my foundation in Electrical Technician from secondary school.
